This is a standalone fix for the In-Game Runtime Error that occurred for both retail and PS2 versions of Call of Duty: World at War (and for some retail versions of Black Ops). According to the Codemasters Support Forum, this fix has been made for PlayStation 3 and retail versions of the game. You can download it here. Note that this fix will not work for the 360 versions. Installing the fix: 1) Uninstall the game. 2) Install the fix. 3) Run game and enjoy! Well, it looks like everyone is having a good time. Heh. I hope that one day Codemaster releases the PS3 fix, if only because I don't own a PS3, and I want to be able to play the PS3 version of the game. But until then, we can all play the PC version. Disclaimer: The following mod may contain bugs, and may actually be unstable, especially when combined with other mods. There is a large possibility that you will kill your save files or corrupt your game files when using this mod. I am in no way responsible for the damage that you do to your save files, in case you use this mod. Contents The main issue I was having was that my list of DLCs showed up as an unknown, and so my list of game options wouldn't refresh. I was able to fix this problem, and should now be able to play the game as intended. This is a fix for the major issue with the game, which causes your games saved to load into the incorrect files (with patches applied). You have to do a full uninstall of the game and install the fix. Warning: If you do not have the game installed, this mod will install all the DLC and other patches that are available at the time of this release. - 1/3rd of the way down the page you will see "Call of Duty: World at War v1.0 [EN] - No-DVD/Fixed EXE" - Click the download link for the file and get a 82157476af
